

Daniel Kuo

C9354

a)

My view about the statement is that the suggestion provided is correct and that it should be implemented.

One of the major reasons would be that objects or variables which are not being used by the program are simply a waste to the memory so to provide delete operation (deleting an item explicitly after task has been performed) or a logic of some sort that would automatically delete these objects / variables from memory will really be helpful, as it will yield less wastage of memory. This could make the code a little complex but will yield to efficiency of program with better memory management.

b)

Not totally sure on this but it might be a good idea as objects are handy to be reused in case of any changes to be made rather than changing full set of code.
